

WI have to manage configurations or features of Health plan management applications.

Application configuration has following entities

Tenant, Carrier, Market Place, market segment configuration and product/module settings

For example, Cambria is a Tenant and also a carrier selling plans in Market places: New Jersey and Georgia under market segments Small Group, ICHRA and the product types: Medical,, ancillary etc with modules settings for group profile, census etc

There will be config templates. Base templates or core product templates and then carrier specific templates

Configuration will be inheritable. Carrier profile configurations can be inheritable at market place level. Each level will have default settings.

Define proper design with design overview, summary, confio structure and examples
